

Using Spent Brewery Grain to Suppress Acid Rock Drainage from Historic Tailings

James Gusek, Tahne Corcutt (B2C), and Lee Josselyn

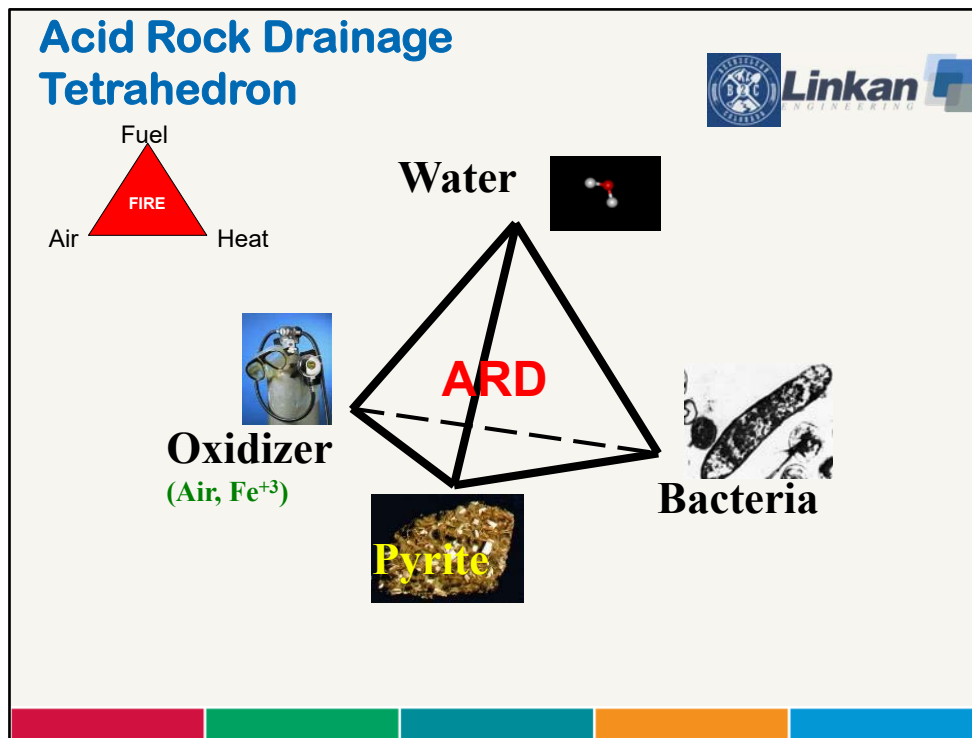

Thanks for inviting us to participate. I'd like to acknowledge my co-authors Tahne Corcutt and Lee Josselyn.

OUTLINE

- ARD Suppression Background**
 - ARD Tetrahedron
 - How Bactericides Work
 - Why Use Spent Brewery Grain?
- The Site**
- The Test**
 - Sample Collection
 - Test Setup
- Results**
- ProofPassive test kits**

We're basically going to cover four main topics: a bit of ARD Suppression background, a look at the site, how we tested the concept of using brewery waste to suppress acid rock drainage, and the test results. **and - full disclosure, a little commercial at the end.**

Before we get started, we need to understand that ARD formation is analogous to the combustion triangle we all learned in elementary school. Cut off the air, fuel or heat supplies and you won't have a fire. **(CLICK)**

ARD formation is similar, you need pyrite (of course), air, water and not fully appreciated, bacteria: acidithiobacillus ferro-oxidans . Cut off one or more corners of the ARD tetrahedron, and ARD kinetics is greatly suppressed. But if you cut off the bacteria corner, you can slow the kinetics of ARD formation by 3 orders of magnitude (**that's a thousand times slower**).

Acid Rock Drainage Tetrahedron

DO NOTHING = **PERPETUAL TREATMENT**

DO SOMETHING (anything) = **PATHWAY TO WALK-AWAY**

It's not enough to kill the bad bacteria, just killing the bacteria leads to short term control but you need to something, right?

Acid Rock Drainage Tetrahedron

**“PROBIOTIC”
PATHWAY TO WALK-AWAY**

We need to replace/displace them with good bacteria. With apologies to Jamie Lee Curtis and the folks who make Activia, think of this as a “probiotic” pathway to walking away from perpetual ARD treatment.

How Bactericides Work

Anionic Surfactants – Sodium Lauryl Sulfate (SLS) – think shampoo

After Baker-Austin & Dopson (2007)

(Organic Acids)

Tuttle, et al. 1977

How can a microbe survive in low pH water? It has evolved an oily “cloak” that keeps the ARD out and it uses proton pumps to keep the protoplasm circum-neutral. The shampoo destroys the cloak and the ARD floods in, killing the bug – it basically stews in its own juices and it’s hard to evolve an adaptive strategy. **[CLICK]**

Unlike the soap, organic acids just weaken the cell membrane so that the contents leak out – kind of like stabbing someone in an artery. Humic acids generated by plants in the root zone are a sustainable source of bactericides. Vegetation is a gift that keeps on giving.

Organic Amendments

- Spent brewery grain (Lindsay et al., 2010)**
- Waste milk & dairy products (Jin et al., 2008)
- Organic acids (Tuttle, et al., 1977)
- Composted sewage sludge (Pichtel & Dick, 1990)
 - Composted paper mill sludge (ditto)
 - Pyruvic acid (ditto)
 - Water-soluble extract from composted sewage sludge (ditto)

So organic amendments work too – a lot of these are considered waste. But the mechanism is a little different from shampoo. As you’ll see, we focused mostly on the spent brewery grain but have included some milk and shampoo cells for comparison.

Why Use Spent Brewery Grain?

It looks like a soggy granola bar – it can hold a LOT of moisture – very difficult to dry it out.

Why Use Spent Brewery Grain?

1. You can find it virtually everywhere
2. It's probiotic, contains good suite of microbes to out-compete acidophiles
3. It has an ability to suppress ARD (Lindsay, et al., 2010 and this study)
4. It can improve the agricultural characteristics of mine waste (more carbon content & moisture holding capacity)
5. Using it "closes the loop" in beneficial use in addition to existing animal feed applications; reduce landfill disposal
6. Tahne thought it would be great to involve breweries in mined land reclamation to protect precious water resources and access private capital to help fund these projects...good beer needs clean water!

Brewery grain has a lot going for it; it's everywhere, research a decade ago shows it can suppress ARD; it helps to grow plants on mine wastes and using it to reclaim mine land helps to further close a loop.

When my co-author Tahne heard me talk about this during my 2018 presentation in Creede, she thought it was a great concept (and here we are).

The Site – Atlas Tailings, Ouray County, Colorado

Tahne's connections on the Western Slope of Colorado lead to the identification of our test site. With the cooperation of the landowners, we embarked on collecting preliminary samples for characterization in 2019.

The Site – Atlas Tailings, Ouray County, Colorado

- 3.1 tons/kt pyritic sulfur in “red” tailings adjacent to Sneffels Creek
- Paste pH 3.4, no alkalinity
- Planned reclamation by Colorado Div. of Mining, Reclamation & Safety (DRMS) & Trout Unlimited
- Lead and potential cadmium, silver, & zinc loading in Sneffels Creek
- Suspected *Anglesite* (PbSO_4) presence (*Galena* weathering product)
- Elevation 10,700 ft. / 3,262 meters
- Mixed ownership (public/private)

The tailings only have 3.1 tons of pyritic sulfur per kiloton – that’s only 0.31%: not much. But because of the lack of alkalinity, the tailings have a paste pH of 3.4 and exhibit elevated amounts of lead with other heavy metals.

I never saw this in the information on the site, but I suspect that one source of lead in the red tailings is the mineral Anglesite, which is a galena or lead sulfide weathering product. Any geochemists out there? Does this make sense?

Sampling/ Tailing Collection

Team members Jim Gusek, Jeff Litteral (DRMS), and Tahne Corcutt work together at the Atlas Mill site near Ouray.

Samples were collected in the fall and early winter of 2019.

B2C Engages Local Communities

Ouray High School students help to transport fifteen cubic feet (1,150 pounds) of tailing material from the Atlas Mill site to the Beer2Clear lab.

Future engineers & scientists?

Tahne had some great help from the students at Ouray High School Science Program and their teacher, Beth Lakin. Excuse me, but you say you need a permission slip from your parents to do **WHAT?**

Test Setup (based on lab screening)

| Test # | Red Atlas Tailings (kg) | Brewery Waste (BW) | Milk | Ag Lime | Manure Inoculant | Veg. Cover | Buffered SLS Rinse | Logic |
|--------|-------------------------|--------------------|------|---------|------------------|------------|--------------------------|--|
| 1 | 20 | | | | | | | Control |
| 2 | 20 | | | | | X | | Control w/veg |
| 3 | 20 | Low % BW | | | X | X | Yes, but only if pH <5.5 | BW in entire soil column, low concentration, no lime |
| 4 | 20 | Med % BW | | | X | X | Yes, but only if pH <5.5 | BW in entire soil column, medium concentration, no lime |
| 5 | 20 | High % BW | | | X | X | Yes, but only if pH <5.5 | BW in entire soil column high concentration, no lime |
| 6 | 20 | Low % BW | | X | X | X | | BW in entire soil column, low concentration, w/lime |
| 7 | 20 | Med % BW | | X | X | X | | BW in entire soil column, medium concentration, w/lime |
| 8 | 20 | High % BW | | X | X | X | | BW in entire soil column high concentration w/lime |
| 9 | 20 | Low % BW | X | X | X | X | | BW in entire soil column, low concentration w/milk & lime |
| 10 | 20 | Med % BW | X | X | X | X | | BW in entire soil column, med. concentration w/milk & lime |
| 11 | 20 | High % BW | X | X | X | X | | BW in entire soil column high concentration w/milk & lime |
| 12 | 20 | | X | X | X | X | | No BW, just milk & lime (Non-BW semi-control) |
| 13 | 20 | Low % BW | | X | X | X | Yes, but only if pH <5.5 | BW in just upper soil column, low concentration, w/lime |
| 14 | 20 | Med % BW | | X | X | X | Yes, but only if pH <5.5 | BW in just upper soil column, medium concentration, w/lime |
| 15 | 20 | High % BW | | X | X | X | Yes, but only if pH <5.5 | BW in just upper soil column, high concentration w/lime |
| 16 | 20 | | | | | | X | Once, week 0 to test SLS longevity |
| 17 | 20 | | | | | | X | Week 0 and whenever pH drops to <5.5 (multiple applications) |
| 18 | 20 | | | | | X | X | Once, week 0 to test SLS longevity with vegetation |
| 19 | 20 | | | | | X | X | Week 0 and whenever pH drops to <5.5 (multiple applications) |
| 20 | 0 | | | | | X | | Background – no tailings with vegetation |

Based on some preliminary lab screening results (click), we developed an ambitious suite of kinetic test cell recipes. Most of the test cells involved various amounts of brewery waste, milk, and sodium lauryl sulfate. We had three controls, one of which was a bucket filled with native soil. Most, but not all of the test cells had a vegetative cover that was provided by a native seed mix planted in a biotic soil medium.

Mixing and Measuring

Over the space of several days, the mixtures were prepared in Tahne's garage "lab" and the mixtures were placed in the test units.

Proof of Concept Kinetic Cell Tests

Beer2Clear team members prepare specific amendments or “recipes” for 20 kinetic cells to test the ability of brewery waste to stop ARD.

The 20 KCTs were assembled in Tahne’s back yard in January of 2020. Initially, they were concerned about the brewery waste attracting the local deer herd but they seemed to lose interest once the brewery waste was mixed with tailings.

Vegetative Cover

(not too successful)

- Junegrass - 0.9 PLS/ac.
- Needle & Thread Grass - 18 PLS/ac.
- Galletagrass – 9 PLS/ac.
- Muttongrass – 1.5 PLS/ac.
- Un-vegetated Tests
 - #1 Control
 - #16 SLS one application
 - #17 SLS multi-applications (pH driven)

We used a seed mix that was similar to the one that DRMS would be using on the site **but multiplied it times THREE**. Three test cells did not receive seed. Vegetation establishment wasn't very successful. However, the plant growth media on the surface may have prevented oxygen exchange. We've had this problem on other projects.

Raw Leachate Data

- pH
- Oxidation Reduction Potential (ORP)
- Conductivity
- Temperature
- Alkalinity (field)
- Leachate Color & Odor
- Monthly precipitation (rain or snow) [rain gage]
- Volume of synthetic rainfall added
- Volume of leachate collected
- Dissolved ICP metals and sulfur/sulfate (3 events analysis at Colorado School of Mines)

So, what did we measure? Field parameters were pH, ORP, conductivity, temperature and alkalinity. Tahne took notes of leachate appearance and we semi-tracked the water balance in and out the test cells. Due to the dry weather, she had to add synthetic rain to generate leachate. This was a pro-bono test; Tahne submitted three samples to the Colorado School of Mines for analysis via ICP/AES. Her biggest challenge was filtering some of the high organic content leachates.

So let's look at some of the data.

Results – July Sampling Event

| Kinetic Cell Test | pH (s.u.) | Oxidation Reduction Potential (ORP) (mv) | Conductivity (µS/cm) | Alkalinity mg/L (@pH>6.0) | Leachate Volume (mL) | Comments |
|---------------------|-----------|--|----------------------|---------------------------|----------------------|-----------------|
| 1 Control | 5.56 | 262 | 246 | 0 | 200 | Orange Leachate |
| 2 Control +Veg | 7.40 | 223 | 140 | 25 | 750 | "Weak Tea" |
| 3 Low BW no lime | 7.48 | 227 | 98 | 40 | 700 | Clear Leachate |
| 4 Med. BW no lime | 7.19 | 257 | 1,298 | 35 | 450 | "Weak Tea" |
| 5 High BW no lime | 8.5 | 165 | 6,008 | 270* | 500 | "Black Tea" |

| 8 High BW w/lime | 8.42 | 184 | 1,876 | 240 | 500 | "Strong Tea" |
| 9 #6 + milk | 7.38 | 238 | 500 | 20 | 850 | "Weak Tea" |
| 10 #7 + milk | 8.35 | 189 | 2,780 | 250 | 300 | "Weak Tea" |
| 11 #8 + milk | 8.14 | 193 | 5,936 | 240 | 400 | "Black Tea" |
| 12 No BW milk& lime | 7.34 | 242 | 198 | 30 | 350 | Clear Leachate |
| 13 ½ BW w SLS | 7.73 | 223 | 374 | 55 | 550 | "Strong Tea" |
| 14 ½ BW w SLS | 7.13 | 251 | 618 | 50 | 700 | "Strong Tea" |
| 15 ½ BW w SLS | 7.32 | 235 | 1,224 | 80 | 950 | "Black Tea" |
| 16 SLS once no veg | 5.35 | 334 | 172 | 0 | 300 | Orange Leachate |
| 17 SLS multi no veg | 5.78 | 277 | 220 | 0 | 200 | "Weak Tea" |
| 18 SLS once w/veg | 6.49 | 271 | 100 | 15 | 525 | "Weak Tea" |
| 19 SLS multi w/veg | 6.61 | 272 | 94 | 15 | 750 | Clear Leachate |
| 20 Baseline | 8.13 | 174 | 3,072 | 180 | 550 | "Weak Tea" |

#5 - * Max'd out alkalinity test

So here are the field measurements from the July event. Lots of data here but let's first focus on "clear leachate" KCTs: #3, #12, and #19. They all have consistently very low conductivity values, circum-neutral pHs and modest alkalinity increases. You can look at the data more closely at your leisure if you download the presentation.. The "clear leachate cells compare favorably with the control plus vegetated cell (#2) - **High Alkalinity and conductivity correlation with high organics.** Now let's fast forward to the end of the test.

Results – November Sampling Event

| Kinetic Cell Test | pH (s.u.) | Oxidation Reduction Potential (ORP) (mv) | Conductivity (µS/cm) | Alkalinity mg/L (@pH>6.0) | Leachate Volume (mL) | Comments |
|---------------------|-----------|--|----------------------|---------------------------|----------------------|-----------------|
| 1 Control | 5.54 | 348 | 106 | 0 | 1000 | Orange leachate |
| 2 Control +Veg | 7.10 | 246 | 46 | 15 | 500 | Clear leachate |
| 3 Low BW no lime | 7.63 | 152 | 206 | 35 | 1200 | Green leachate |
| 4 Med. BW no lime | 6.21 | 272 | 268 | 10 | 25 | Weak tea |
| 5 High BW no lime | 5.97 | 280 | 1,598 | 0 | 200 | Weak tea |
| 6 Low BW w/lime | 7.12 | 225 | 18 | 20 | 1000 | Clear leachate |
| 7 Med BW w/lime | 6.61 | 235 | 110 | 15 | 450 | Weak tea |
| 8 High BW w/lime | 6.6 | 219 | 248 | 10 | 1350 | Weak tea |
| 9 #6 + milk | 8.05 | 150 | 62 | 10 | 1200 | Green leachate |
| 10 #7 + milk | 5.96 | 248 | 88 | 0 | 700 | Weak tea |
| 11 #8 + milk | 7.35 | 248 | 30 | 20 | 1900 | Clear leachate |
| 12 No BW milk& lime | 7.22 | 286 | 164 | 30 | 350 | Green leachate |
| 13 ½ BW w SLS | 6.70 | 293 | 62 | 15 | 200 | Weak tea |
| 14 ½ BW w SLS | 7.08 | 197 | 1,394 | 30 | 1000 | Orange leachate |
| 15 ½ BW w SLS | 6.52 | 215 | 1,854 | 30 | 100 | Green leachate |
| 16 SLS once no veg | 5.06 | 355 | 144 | 0 | 200 | Orange leachate |
| 17 SLS multi no veg | 5.52 | 333 | 86 | 0 | 300 | Orange leachate |
| 18 SLS once w/veg | 7.1 | 238 | 36 | 20 | 4000 | Weak tea |
| 19 SLS multi w/veg | 7 | 246 | 22 | 15 | 1500 | Weak tea |
| 20 Baseline | 7.32 | 272 | 194 | 40 | 600 | Clear leachate |

So here are the field measurements from the November event.

Again we have a few cells producing clear leachate and a lot of cells, including the Control, producing orange leachate Lot's of data here but let's first focus on "clear leachate" KCTs: #6 and #11. They all have consistently very low conductivity values, circum-neutral pHs and modest alkalinity increases. The "clear leachate cells compare favorably with the control plus vegetated cell (#2) suggesting that vegetation alone isn't a bad idea. We have some interesting "green" leachate observed in 3, 9, and 15 – this is suspected to be ferrous iron. Now let's look at the ICP metals and sulfate. (click)

Results – ICP Metals & Sulfate Summary

| | Lead | | | Sulfate | | | Iron | | |
|---|-------------|------------|------------|-------------|------------|------------|-------------|------------|------------|
| | March, 2020 | July, 2020 | Nov., 2020 | March, 2020 | July, 2020 | Nov., 2020 | March, 2020 | July, 2020 | Nov., 2020 |
| 1 Control | 2.73 | No data | 4.05 | 64 | No data | 183 | 0.059 | No data | 0.047 |
| 2 Control w veg | 2.27 | 0.06 | 0.5 | 55 | 3 | 12 | 0.15 | 0.009 | 0.15 |

| 4 Med BW no ag lime | 0.44 | 0.01 | 0.04 | 126 | 14 | 113 | 0.078 | 0.003 | 0.04 |
| 5 High BW no ag lime | 0.97 | 0.12 | 0.83 | 230 | 90 | 993 | 0.47 | 0.11 | 0.74 |
| 6 Low BW OC ag lime | 0.57 | 0.01 | 0.05 | 203 | 3 | 7 | 0.065 | 0.001 | 0.01 |
| 7 Med BW ag lime | 0.43 | 0.01 | 0.16 | 278 | 63 | 777 | 0.086 | 0.005 | 0.33 |
| 8 High BW ag lime | 0.97 | 0.03 | 0.34 | 229 | 38 | 327 | 1.265 | 0.017 | 0.33 |
| 9 Low BW ag lime, milk | 0.28 | 0.01 | 0.04 | 286 | 2 | 9 | 0.15 | 0.002 | 0.07 |
| 10 Med BW ag lime, milk | 0.21 | 0.03 | 0.22 | 384 | 57 | 652 | 0.20 | 0.014 | 0.36 |
| 11 High BW ag lime, milk | 0.43 | 0.30 | 0.47 | 449 | 168 | 529 | 0.29 | 0.71 | 0.39 |
| 12 Milk & Ag lime only, No BW | 0.67 | 0.02 | 0.11 | 402 | 7 | 128 | 0.069 | 0.002 | 0.01 |
| 13 Low BW in Upper Zone, rinse if pH<5.5 | 1.89 | 0.11 | 0.53 | 63 | 5 | 35 | 0.14 | 0.029 | 0.17 |
| 14 Med BW in Upper Zone, rinse if pH<5.5 | 3.33 | 0.24 | 1.62 | 45 | 34 | 259 | 0.17 | 0.085 | 0.066 |
| 15 High BW in Upper Zone, rinse if pH<5.5 | 2.29 | 0.04 | 0.7 | 49 | 21 | 448 | 0.24 | 0.041 | 1.02 |
| 16 No BW, Milk etc. NO VEG Buffered Rinse Wk 0 ONLY | 2.98 | 0.21 | 4.28 | 39 | 8 | 74 | 0.006 | BDL | 0.02 |
| 17 No BW, Milk etc NO VEG Buffered Rinse Wk 0 or if pH<5.5 | 1.30 | 0.4 | 8.6 | 44 | 14 | 78 | 0.068 | 0.004 | 0.02 |
| 18 No BW, Milk etc. YES VEG Buffered Rinse Wk 0 | 3.32 | 0.11 | 88 | 60 | 2 | 2 | 0.076 | 0.008 | 0.26 |
| 19 No BW, Milk etc YES VEG Buffered Rinse Wk 0 or if pH<5.5 | 3.36 | 0.07 | 1.1 | 54 | 3 | 14 | 0.089 | 0.004 | 0.18 |

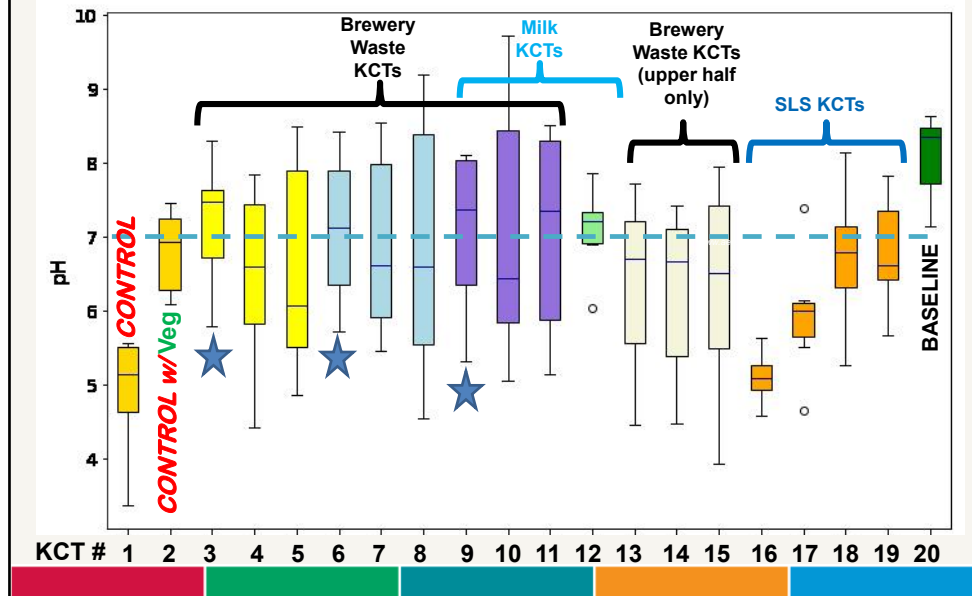

Here's where the distinctions start to emerge. The two controls (#1 & #2) released a LOT of lead at startup (CLICK) and so did the low BW cells (#13, 14, & #15) and the SLS cells (#16 to #19) [CLICK]

No 2 with the vegetation was still leaching lead at the end of the test.

Most of the BW cells (with the exception of the #5 High BW) released very little lead at startup. No. 3 is looking pretty good (CLICK) with low lead, low sulfate & iron (virtually zero pyrite oxidation). #6 (CLICK) is not that far behind (click). #9 rounds out the favorites with respect to lead, sulfate, and iron concentrations. **Click.** The green stars are the cells that produced green leachate. This is probably ferrous iron – only #15 with the high BW exhibited really high iron but #5 leachate was “weak tea” in color in the final sampling event.

The Control exhibited orange leachate and elevated lead throughout the test.

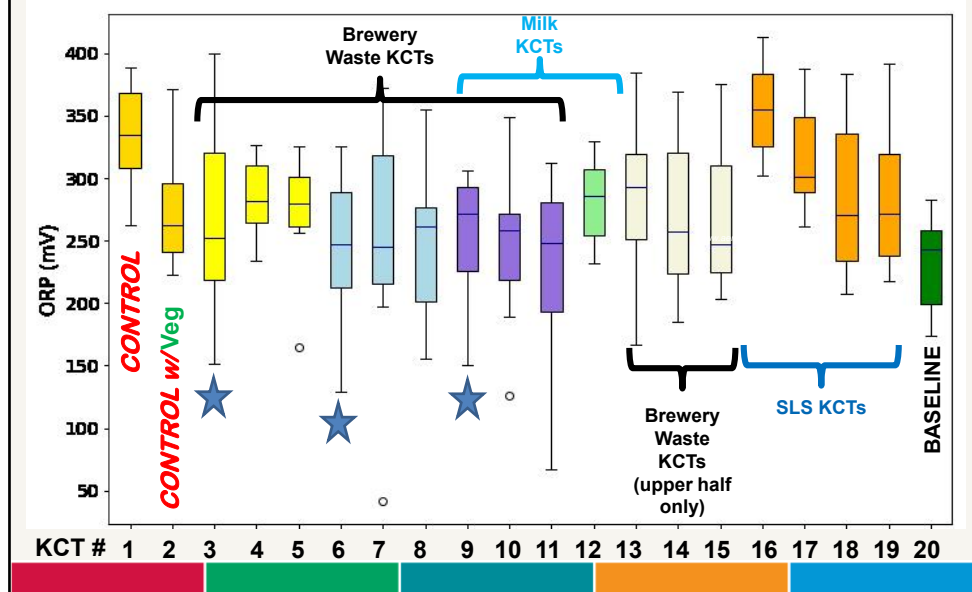

Results – pH Summary

The raw pH data can be used as an indicator of how steady the pH values were through the test. **In many instances, it took several months for the pH to increase.** Some of the pH peaks were associated with higher amounts of organic carbon either in the form of Brewery waste or milk. This might have been due to alkalinity generated by sulfate reducing bacteria.

The SLS cells didn't do as well as the brewery waste; stopping pyrite oxidation didn't prevent the mobilization of the stored acidity.

Results – ORP Summary

Lastly, let's look at the Oxidation reduction potential. We had some really low observations as show by some of the outliers (dots) Lower values are good as pyrite is less likely to oxidize.

Our favorites so far are #3, #6, and #9 and they all have low ORPs comparatively.

Potential Winners

| Kinetic Cell Test | pH (s.u.) | Oxidation Reduction Potential (ORP) (mv) | Conductivity (µS/cm) | Alkalinity mg/L (@pH>6.0) | March Lead (mg/L) | July Lead (mg/L) | November Lead (mg/L) | Comments |
|---|-----------|--|----------------------|---------------------------|-------------------|------------------|----------------------|-----------------|
| 1 Control | 5.54 | 348 | 106 | 0 | 2.73 | No data | 4.05 | Orange Leachate |
| 2 Control + Veg | 7.10 | 246 | 46 | 15 | 2.27 | 0.06 | 0.5 | Clear Leachate |
| 3 Low BW in the entire mass, no lime | 7.63 | 152 | 206 | 35 | 0.49 | 0.01 | 0.05 | Green Leachate |
| 6 Low BW in the entire mass w/lime | 7.12 | 225 | 18 | 20 | 0.57 | 0.01 | 0.05 | Clear Leachate |
| 9 Low BW in the entire mass w/lime & milk | 8.05 | 150 | 62 | 10 | 0.28 | 0.01 | 0.04 | Green Leachate |
| 20 Baseline native soil with vegetation | 7.32 | 272 | 194 | 180 | No data | No data | No data | Clear Leachate |

Nov., 2020 Final Field Data

Our three potential winners are Numbers 3, 6, and 9 which had the lowest brewery waste amounts among their respective clusters. This goes to show that too much of a good thing (brewery waste or milk) may not be appropriate in all situations. If there was more pyrite present in the Atlas Tailings, **or they were not as weathered**, perhaps other mixtures would have been better.

End Game “By the Book”

- ❑ **TCLP Testing (failed for lead content)**
- ❑ **1,500 lbs. of tailings**
- ❑ **Four 55-gallon drums disposed responsibly**
- ❑ **Clean Management Environmental Group**
- ❑ **\$3,000 price tag for disposal**

No good deed goes unpunished. For a variety of reasons, we couldn't return the materials back to the site or find a new home for them. They failed the TCLP test for lead. Tahne arranged with the Clean Management Environmental Group and spoke very highly of them.

lee.josselyn@linkan.biz

Thanks for your attention – I hope your mind is a little more prepared now, especially as you down your next beer (cheers!)

Does anyone in the audience know the connection that Louis Pasteur had with beer? Sorry, no prizes except bragging rights.

Answer: Pasteur observed that by holding beer at between 131°F and 149°F (55°C–60°C) for a short time, the growth of beer spoilage organisms was inhibited, and the beer could be rendered palatable for up to 9 months. ... This is the basis of the process of pasteurization. (www.beer&brewing.com)

ProofPassive™ Self Test Kit

“When the only tool in your toolbox is a hammer, everything looks like a nail”. When I started my career in passive treatment, I thought that biochemical reactors (BCRs) could solve almost any mining influenced water (MIW) problem. Fast forward a few decades and the reality is that the passive treatment design toolbox contains more options. If you’re or a co-worker are confronted with the question as to whether passive treatment processes could work at your site, perhaps Linkan Engineering can help. We’ve condensed our experience into a simple customized ProofPassive test kit that we’d ship to you with clear instructions geared to guide you in assessing the basics of passively treating your MIW. In the process, you’ll have Linkan’s expertise supporting you every step of the way.

The ProofPassive test kit results could provide you with data to make an informed decision about adopting this technology in closing your mine site.
